adapting a real app for

IPHONE DUO

EPISODE 3: SHEETS

Every code snippet from the video, before and after, in order.

by Craig Clayton

HOW TO READ THIS

BEFORE the code as it was in Countdown2Binge.
AFTER the code after the change.
NEW code that did not exist before.

Snippets that pair up say so, for example "Pairs with 01."
presentationPlacement(_:) needs iOS 27. Snippet 02 shows how to guard it for iOS 26.
Built with the Xcode 27.1 RC. All three snippets are the code in the app.

01 The Your Alerts Sheet BEFORE

Views/Timeline/FollowedShowDetail.swift, the sheet the bell opens.

> **NOTE**
> No placement is set, so the system decides. On iPhone Duo, partially open, the sheet opened on the left side of the fold, while the bell that opens it sits in the toolbar strip on the right.

```
        .sheet(isPresented: $showAlerts) {
            ShowAlertsSheet(series: series, onDismiss: { showAlerts = false })
        }
```

02 The iOS 26 Wrapper NEW

Utilities/Extension+PresentationPlacement.swift. presentationPlacement(_:) needs iOS 27.

> **NOTE**
> PresentationPlacement doesn't exist on iOS 26, so the wrapper can't take a placement as a parameter. If it did, the wrapper would need iOS 27 too, and every call would need its own check. So it names the one placement the app needs. On iOS 26 the view is returned unchanged.

```
import SwiftUI

extension View {
    /// Opens this sheet on the trailing side, on iOS 27 and later.
    @ViewBuilder
    func trailingPlacementIfAvailable() -> some View {
        if #available(iOS 27.0, *) {
            presentationPlacement(.trailing)
        } else {
            self
        }
    }
}
```

03 The Sheet, One Line Added AFTER

Views/Timeline/FollowedShowDetail.swift. Pairs with 01.

> **NOTE**
> The modifier goes on the sheet's content, inside the .sheet closure, not on the button that opens it.
> Apple's docs say only sheet presentations respect this placement. The sheet now opens on the trailing side, the same side as the bell.

```
        .sheet(isPresented: $showAlerts) {
            ShowAlertsSheet(series: series, onDismiss: { showAlerts = false })
                .trailingPlacementIfAvailable()
        }
```
