IPHONE DUO

10 THINGS YOU NEED TO KNOW

Every code snippet from the video, in order.

by Craig Clayton

WHAT CHANGED FROM THE VIDEO

Corrected, because the video's code is wrong: Points 2, 4, 8, and 9

Added for accuracy: Point 5b

Placeholder, not real code: Point 6

Each corrected snippet is marked below, with what the video shows and what to use instead.

Points 2, 4, and 9 need iOS 27.1, and 5b needs iOS 27.0, so guard them with `#available` if you support iOS 26.

Compiled against the iOS 27.2 SDK. Not yet run on a device.

01 Two Size Classes

```
@Environment(\.horizontalSizeClass) var hSize
```

02 Controls Move to the Side

CORRECTION

The video puts `.axisBehavior` after the `.toolbar` block, on the view. That does not compile. It goes on the `ToolbarItem`, as shown below. Needs iOS 27.1.

```
.toolbar {  
    ToolbarItem(placement: .topBarLeading) {  
        Button("Filter", systemImage: "line.3.horizontal.decrease") { }  
    }  
    .axisBehavior(.verticalPreferred)  
}
```

03 Offset vs. Center

```
VStack {  
    // your content  
}  
.padding(.leading, geo.safeAreaInsets.leading)
```

04 The Fold Displaces Content

CORRECTION

The video shows `onGeometryChange` with only one closure. That does not compile. It needs an action closure, as shown below. Needs iOS 27.1.

```
.onGeometryChange(for: [ReservedRegion].self) { proxy in
    proxy.reservedRegions(kind: .division, options: .includeInactive)
} action: { regions in
    // react to the regions
}
```

05a Use the Space Deliberately

Split

```
NavigationSplitView {
    ShowListView()
} detail: {
    ShowDetailView()
}
```

05b Use the Space Deliberately

Sidebar

ADDED

The video's version compiles. Apple documents this modifier for the `sidebarAdaptable` tab view style, so the style is added below. Needs iOS 27.0.

```
TabView {
    // tabs
}
.tabViewStyle(.sidebarAdaptable)
.defaultTabBarPlacement(.sidebar)
```

05c Use the Space Deliberately

Reflow

```
AnyLayout(hSize == .regular
  ? AnyLayout(HStackLayout())
  : AnyLayout(VStackLayout())) {
  PosterView(); MetadataView()
}
```

06 Consistency Across Poses

Anti-pattern — what to avoid

NOTE

pose is a placeholder, not a real API. This snippet illustrates a pattern to avoid. It is not code to copy.

```
if pose == .closed {
  BasicView() // missing features
} else {
  FullView() // different hierarchy
}
```

07 Sheets Behave Differently

```
.sheet(isPresented: $showDetail) {
  ShowDetailSheet()
}
// placement, centering, slide-over — all automatic
```

08 Split View Safe Areas

CORRECTION

The video shows two bare values inside `GeometryReader`. That does not compile, because the closure has to return a view. The corrected version is below.

```
GeometryReader { proxy in
    // do not assume leading equals trailing
    Text("\(proxy.safeAreaInsets.leading), \(proxy.safeAreaInsets.trailing)")
}
```

09 Grids Prefer Even Columns

CORRECTION

The video says this code checks whether a division region is active, but the snippet in the video does not check `isActive`. It does below. Needs iOS 27.1.

```
let columns = reservedRegions.contains(
    where: { $0.kind == .division && $0.isActive })
? Array(repeating: GridItem(.flexible()), count: 2)
: Array(repeating: GridItem(.flexible()), count: 3)
```

10 What Apple Doesn't Prescribe

No code — this point is about the absence of official guidance (no confirmed breakpoints, no Duo-specific type scaling, no official Split View size class).
